**Experiment No: 06** 

**Experiment Name:** Switching an interface to move a host around a network using mininet.

#### **Objectives:**

- > How to install mininet
- ➤ How to prototyping a large network on a single machine by mininet.
- ➤ And implementation and run example program

#### **Description:**

Mininet is a network emulator which creates a network of virtual hosts, switches, controllers, and links. Mininet hosts run standard Linux network software, and its switches support OpenFlow for highly flexible custom routing and Software-Defined Networking.

#### **Source code:**

```
from mininet.net import Mininet
from mininet.node import OVSSwitch
from mininet.topo import LinearTopo
from mininet.log import info, output, warn, setLogLevel
```

from random import randint

```
class MobilitySwitch( OVSSwitch ):

"Switch that can reattach and rename interfaces"

def delIntf( self, intf ):

"Remove (and detach) an interface"

port = self.ports[ intf ]

del self.ports[ intf ]

del self.intfs[ port ]

del self.nameToIntf[ intf.name ]

def addIntf( self, intf, rename=False, **kwargs ):

"Add (and reparent) an interface"

OVSSwitch.addIntf( self, intf, **kwargs )

intf.node = self

if rename:

self.renameIntf( intf )
```

```
def attach( self, intf ):
     "Attach an interface and set its port"
    port = self.ports[ intf ]
    if port:
       if self.isOldOVS():
          self.cmd( 'ovs-vsctl add-port', self, intf )
       else:
          self.cmd( 'ovs-vsctl add-port', self, intf,
                '-- set Interface', intf,
                'ofport request=%s' % port )
       self.validatePort( intf )
  def validatePort( self, intf ):
     "Validate intf's OF port number"
    ofport = int( self.cmd( 'ovs-vsctl get Interface', intf,
                   'ofport'))
    if ofport != self.ports[ intf ]:
       warn( 'WARNING: ofport for', intf, 'is actually', ofport,
           '\n')
  def renameIntf( self, intf, newname="'):
     "Rename an interface (to its canonical name)"
    intf.ifconfig( 'down' )
    if not newname:
       newname = '%s-eth%d' % ( self.name, self.ports[ intf ] )
    intf.cmd('ip link set', intf, 'name', newname)
     del self.nameToIntf[ intf.name ]
    intf.name = newname
     self.nameToIntf[ intf.name ] = intf
    intf.ifconfig( 'up' )
  def moveIntf( self, intf, switch, port=None, rename=True ):
     "Move one of our interfaces to another switch"
    self.detach( intf )
     self.delIntf( intf )
     switch.addIntf( intf, port=port, rename=rename )
     switch.attach( intf )
def printConnections( switches ):
  "Compactly print connected nodes to each switch"
  for sw in switches:
    output( '%s: ' % sw )
    for intf in sw.intfList():
       link = intf.link
       if link:
```

```
intf1, intf2 = link.intf1, link.intf2
         remote = intf1 if intf1.node != sw else intf2
         output('%s(%s)' % (remote.node, sw.ports[intf]))
    output('\n')
def moveHost( host, oldSwitch, newSwitch, newPort=None ):

#### **Discussion:**

From this lab experiment i used mininet and others functionality to implement the code and run. We check simple mobility test by mininet.

h1,h2,h3 are hosts and s1,s2,s3 are switches. We move a host from s1 to s2, s2 to s3, and then back to s1. we check simple mobility test among the hosts.

We can implement other mobility test through mininet
